According to our (Global Info Research) latest study, the global Hall Joystick market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A Hall joystick is a type of joystick that uses the Hall effect to measure the position of the stick. The Hall effect is a phenomenon that occurs when a magnetic field affects the flow of electric current in a conductor, creating a voltage difference across the conductor. A Hall joystick has a permanent magnet attached to the stick and a Hall sensor on the base. As the stick moves, the magnet changes its position relative to the sensor, causing a change in voltage that corresponds to the stick's position. A Hall joystick does not have any physical contact between the moving parts, unlike a potentiometer joystick, which uses a variable resistor to measure the position of the stick. Therefore, a Hall joystick is more durable, accurate, and resistant to drift than a potentiometer joystick.
