Abstracts

The global Hall Speed Sensor market size is expected to reach \$ 1616 million by 2032, rising at a market growth of 7.4% CAGR during the forecast period (2026-2032).

In 2025, global sales of Hall speed sensors reached approximately 125 million units, with an average global selling price of around USD 7.6 per unit. The gross margin of major industry players was approximately 25%–40%. A Hall speed sensor is a non-contact speed sensing device based on the Hall effect, mainly used to detect the rotational speed and direction of gears, magnetic rings, shafts, wheels, or motor rotors. Its operating principle is that when a toothed metal component or magnetic target passes by the sensor, the surrounding magnetic field changes periodically; the Hall IC converts these magnetic field variations into electrical pulse signals, and the control system calculates the rotational speed based on the pulse frequency. The product typically consists of a Hall IC, magnet, signal conditioning circuitry, housing, and lead wires or connectors, offering advantages such as non-contact operation, fast response, wear resistance, and strong resistance to oil, dust, and other harsh operating conditions.

This report studies the global Hall Speed Sensor production, demand, key manufacturers, and key regions.
