Abstracts

The global Halloysite market size is expected to reach \$ 100 million by 2032, rising at a market growth of 7.0% CAGR during the forecast period (2026-2032).

Halloysite is an aluminosilicate clay mineral with the empirical formula $\text{Al}_2\text{Si}_2\text{O}_5(\text{OH})_4$. Its main constituents are aluminium (20.90%), silicon (21.76%) and hydrogen (1.56%). It is a member of the kaolinite family of aluminosilicates but, whereas kaolin particles are platy in shape, halloysite particles are nanotubes, where the aluminosilicate sheets are rolled up like a scroll.

Limited by mineral resources distribution, halloysite production mainly locates in regions, such as North America, Europe and Oceania. Companies, like Imerys, Applied Minerals, I-Minerals, are key producers of halloysite globally. The industry concentration is high.

Halloysite is increasingly used in the ceramics industry due to its unique properties, such as improving strength and thermal stability in clay products. Also, halloysite nanotubes are gaining traction in nanotechnology for applications in drug delivery, as they can encapsulate and release various substances, which drives innovation in pharmaceuticals and materials science.

Expanding downstream industries will promote the whole halloysite market to grow.

This report studies the global Halloysite production, demand, key manufacturers, and key regions.
