Abstracts

According to our (Global Info Research) latest study, the global Hand Geometry Biometrics market size was valued at USD 4889 million in 2023 and is forecast to a readjusted size of USD 14170 million by 2030 with a CAGR of 16.4% during review period.

Security has been a key concern for enterprises, banks, government organizations, telecommunication and hospitals as well as for individuals to secure data and assets. Keys, identity badges, and numeric keypads are used to prevent unauthorised access. Hand geometry biometrics deals with the structure of palm and fingers of an individual, width of the fingers, and thickness of the palm. Hand geometry scanners with infrared light and reflectors can be used for capturing the image. Since these features of an individual are not unique, hand geometry biometrics is not considered to be a fruitful method for the identification and verification of individuals. However, organizations are integrating hand geometry biometrics with smart cards to ensure improved verification of individuals. Multimodal biometrics is also another technique that is being used for authenticating individuals.

The rising interest in biometric systems with multiple-point verification mechanism has a key impact on the global market. The technology used in hand geometry biometrics registers verification of several perimeters of the hand, including the finger length, the finger width and palm size. Unlike fingerprint biometrics, where unlawful access is still viable, it is nearly impossible to duplicate the print of an entire hand. Due to this, the hand geometry biometrics systems are being extensively implemented for authorisation operations.
