Hand lay-up epoxy, also known as hand lay-up fiberglass or hand lay-up laminating, is a process used in manufacturing composite materials, such as fiberglass reinforced plastic (FRP) products. In this process, a liquid resin, typically epoxy, is applied by hand onto a prepared surface, such as a mold or a previously constructed layer of fiberglass, using a brush or roller. The epoxy resin is then cured through a chemical reaction or by exposure to heat, resulting in a rigid and durable composite structure. Hand lay-up epoxy is commonly used in the production of boats, aircraft parts, automotive components, and other industrial applications where lightweight, strong, and corrosion-resistant materials are needed. This process allows for greater control over the thickness and orientation of the reinforcing fibers and is more cost-effective than other composite manufacturing techniques.
