According to our (Global Info Research) latest study, the global Handset Flash LED Modules market size was valued at USD 1449.3 million in 2023 and is forecast to a readjusted size of USD 3423 million by 2030 with a CAGR of 13.1% during review period.

Handsets consist of two types of photo flash LEDs, namely xenon flash and white LEDs. Xenon flash is used in both film and standalone digital cameras. White LED illumination is mostly used in camera phones. LEDs are faster than xenon flash and also enable flash lighting in the video mode, which is not possible with xenon flash. Flash LEDs are brighter and provide two types of lighting: blue LED and white LED. Both these lightings use Indium Gallium Nitride (InGaN). In flash applications, LEDs operate on a pulse current, which is a brief burst of direct current (DC).

LTE migration across markets will be one of the major factors that will have a positive impact on the growth of the market. LTE can deliver more data at high speed and provide a better experience to consumers than 3G. It has been observed that in the developing nations, the operators are compelled to generate revenues from premium data services such as gaming, mobile video, and business apps, which necessitates high LTE bandwidth and low latency. With the increasing penetration of the Internet and wireless communication, there is a rising demand for mobile data services. This will in turn, fuel the need for LTE since it can provide high bandwidth and improved mobility. The deployment of LTE will drive the need for the production of large volumes of handset flash LED modules with LTE specifications, subsequently fueling market growth.
