Abstracts

Handsets consist of two types of photo flash LEDs, namely xenon flash and white LEDs. Xenon flash is used in both film and standalone digital cameras. White LED illumination is mostly used in camera phones. LEDs are faster than xenon flash and also enable flash lighting in the video mode, which is not possible with xenon flash. Flash LEDs are brighter and provide two types of lighting: blue LED and white LED. Both these lightings use Indium Gallium Nitride (InGaN). In flash applications, LEDs operate on a pulse current, which is a brief burst of direct current (DC).

Scope of the Report:

This report focuses on the Handset Flash LED Modules in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes The market based on manufacturers, regions, type and application. LTE migration across markets will be one of the major factors that will have a positive impact on the growth of The market. LTE can deliver more data at high speed and provide a better experience to consumers than 3G. It has been observed that in the developing nations, the operators are compelled to generate revenues from premium data services such as gaming, mobile video, and business apps, which necessitates high LTE bandwidth and low latency. With the increasing penetration of the Internet and wireless communication, there is a rising demand for mobile data services. This will in turn, fuel the need for LTE since it can provide high bandwidth and improved mobility. The deployment of LTE will drive the need for the production of large volumes of handset flash LED modules with LTE specifications, subsequently fueling market growth.

The worldwide market for Handset Flash LED Modules is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
