Haptic Feedback Vibration Motors are small devices that create tactile sensations—like vibrations—to simulate the sense of touch in electronic devices. Commonly used in smartphones, game controllers, wearables, and medical devices, these motors produce vibrations to convey information or enhance user interaction, such as alerting users to a notification or simulating the feel of pressing a button. They work through eccentric rotating mass (ERM) or linear resonant actuator (LRA) technology, offering precise and varied feedback depending on the application's needs.
