A haptic vibration motor is a small device that produces tactile feedback—typically in the form of vibrations—to simulate the sense of touch in electronic devices. It is commonly used in smartphones, wearables, gaming controllers, medical equipment, and other interactive systems to alert users or enhance user experience through physical sensations. These motors come in various types, such as eccentric rotating mass (ERM) motors and linear resonant actuators (LRA), each offering different vibration patterns and response times. By adding a layer of touch-based interaction, haptic vibration motors make digital experiences feel more intuitive and immersive.
