A hardware security module (HSM) is a physical computing device that safeguards and manages digital keys for strong authentication and provides crypto processing. These modules traditionally come in the form of a plug-in card or an external device that attaches directly to a computer or network server. Hardware Security Modules (HSM) are devices specifically built to create a tamper-resistant environment in which to perform cryptographic processes (e.g. encryption or digital signing) and to manage keys associated with those processes. HSMs often provide cryptographic acceleration that is measured in terms of operations. These devices are used to protect critical data processing activities associated with server based applications and can be used to strongly enforce security policies and access controls. These modules are physical devices that traditionally come in the form of a plug-in card or an external network connected appliance and are often validated against security standards such as FIPS.

Global key players of hardware security modules (HSM) include Thales, Entrust Corp, Utimaco, ATOS SE, Marvell Technology Group, etc. The top five players hold a share about 45%. North America is the largest market, has a share about 38%, followed by Europe and Asia-Pacific, with share 33% and 25%, separately.
