According to our (Global Info Research) latest study, the global Hay market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Hay, in agriculture, dried grasses and other foliage used as animal feed. Usually the material is cut in the field while still green and then either dried in the field or mechanically dried by forced hot air. Typical hay crops are timothy, alfalfa, and clover. Given that the protein content of grasses and legumes decreases and fibre and lignified tissue increases as growing plants advance in maturity, a good hay crop must be cut at the proper stage, handled so as to retain the leaves, and cured to prevent spoilage or discoloration. Hay is usually dried in small piles or stacks in the field, but a rainy climate may dictate forced-air curing in the barn. Properly cured hay with 20 percent or less moisture may be stored for months without danger of spoilage. See also straw.
