Abstracts

According to our (Global Info Research) latest study, the global HBM Inspection Equipment market size was valued at US$ 1869 million in 2025 and is forecast to a readjusted size of US$ 4879 million by 2032 with a CAGR of 14.6% during review period.

In 2025, global HBM inspection equipment production reached approximately 3.63 million units, with an average global market price of around US$ 500 per unit. In 2025, the global 's total production capacity of HBM inspection equipment reached 4.53 million units. The industry average gross profit margin of this product has reached 42%.HBM inspection equipment refers to semiconductor-specific equipment used in the manufacturing, advanced packaging, and mass production of high-bandwidth memory (HBM) chips. It performs inspection, measurement, and quality control of DRAM stacked chips, TSVs, micro bumps, hybrid bonding, interposers, RDLs, die stack alignment, package structural defects, and critical dimensional parameters. This type of equipment utilizes technologies such as optical inspection, electron beam inspection, X-ray inspection, infrared inspection, scattering measurement, CD measurement, overlay measurement, and 3D topography analysis to achieve defect identification, dimensional control, yield improvement, and reliability assurance in the HBM manufacturing process. It is a key process control device in the supply chain of advanced computing products such as AI GPUs, HPC, and data center chips. As HBM3, HBM3E, and future HBM4 evolve towards higher stacking layers and more complex structures, the importance of the inspection process continues to increase.

HBM testing equipment has a promising future and is entering a golden period of development with both volume and price increases. With the explosive growth in AI

computing power demand, HBM, as a core component of AI chips, is experiencing a surge in production capacity, directly driving the rigid demand for testing equipment. Because HBM uses a 3D stacking architecture, the number of test lanes has increased dramatically from 3-4 lanes in traditional DRAM to over 15 lanes, making the value of a single unit 5-6 times that of traditional testing equipment, thus driving the continuous expansion of the global market.

The HBM testing equipment industry chain encompasses three segments: upstream components, midstream equipment manufacturing, and downstream applications. The upstream mainly includes suppliers of core components such as probe cards and test boards, as well as software algorithms; the midstream consists of manufacturers such as KLA and Onto Innovation, whose products cover the entire process of wafer testing, aging testing, and system-level testing; the downstream directly serves HBM manufacturers and AI chip and server manufacturers. The value distribution of the industry chain exhibits a clear "smile curve," with extremely high barriers to entry in core technologies. Currently, domestic companies are at a critical stage of transitioning from low localization rates to large-scale substitution.
