Abstracts

According to our (Global Info Research) latest study, the global HCR Air Door market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The basic principle behind HCR Air Doors is to create a counter-flow force that balances the two-way flow-through force caused by air temperature differences between the inside and outside of the cooler or freezer. When there is a temperature difference, warm air tends to flow into the cold space, while cold air tends to flow out of the cold space. This results in heat loss, energy waste, and moisture accumulation on the floor, and ice in the freezer. To prevent this, HCR Air Doors generate a high-velocity air stream that acts as an invisible door, blocking the unwanted air exchange. The air stream is shaped in a curvilinear manner to match the contour of the doorway and to minimize turbulence and leakage. The air stream is also recirculated to reduce energy consumption and to maintain a constant pressure and velocity.
