## Abstracts

The global HD Fluorescence Laparoscopy market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

High-definition fluorescence laparoscope is a medical device used for intra-abdominal observation and surgical operation. It combines laparoscopic technology and fluorescence imaging technology, which can provide high-definition images and more accurate visualization. Traditional laparoscopic surgery uses white light source lighting, while high-definition fluorescent laparoscopy injects fluorescent dye into the patient's body, and then uses a specific fluorescent imaging system for observation and photography. The absorption and emission characteristics of fluorescent dyes in the body allow doctors to see blood vessels, lymph nodes, tumors and other tissue structures more clearly, improving the accuracy and safety of surgery.

This report studies the global HD Fluorescence Laparoscopy production, demand, key manufacturers, and key regions.
