According to our (Global Info Research) latest study, the global HDTV SoC market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

HDTV SoC refers to an integrated circuit or chip specifically designed and optimized for the processing, decoding, and display of High-Definition Television (HDTV) signals.

HDTV SoCs incorporate multiple components onto a single chip, including a digital video decoder, audio decoder, graphics processing unit (GPU), memory interface, video and audio output interfaces, and various other peripherals. This integration allows for efficient processing and delivery of high-definition content.

HDTV SoCs often include dedicated graphics processing units (GPUs) that handle video rendering and enhancement tasks, such as image upscaling, noise reduction, color correction, and high dynamic range (HDR) processing. These features contribute to the improved visual experience offered by HDTV.

HDTV SoCs support advanced audio encoding and decoding technologies, such as Dolby Digital or DTS (Digital Theater Systems), to provide immersive and high-quality audio output. They also offer audio output options, including multi-channel surround sound, to complement the enhanced video experience.

Some HDTV SoCs incorporate connectivity options like HDMI, Ethernet, or USB, allowing for seamless integration with external devices or internet connectivity. They may also support smart TV functionalities, including app support, video streaming services, and interactive features.
