Abstracts

The global Healthcare Natural Language Processing (NLP) market size is expected to reach \$ 4769 million by 2032, rising at a market growth of 16.6% CAGR during the forecast period (2026-2032).

Natural language processing (NLP) is a branch of artificial intelligence that deals with the interaction between computers and humans using the natural language (spoken or written data), not in the artificial languages such as Java and C++. The application of Natural Language Processing (NLP) in healthcare refers to the use of AI language technology to automatically identify, parse, and structure medical text data (such as electronic medical records, doctor's notes, and image reports), thereby improving the efficiency and quality of medical services. Through semantic understanding, entity recognition, and text summarization, it helps doctors quickly obtain key information, assists clinical decision-making, and reduces paperwork burden.

In the healthcare field, downstream applications of NLP encompass Hospital Information Systems (HIS), Clinical Decision Support Systems (CDSS), medical insurance review systems, and patient service platforms, contributing to the intelligent and efficient processing of medical procedures. Future development will focus on multimodal fusion, integrating text, image, and genetic data to improve diagnostic accuracy; ensuring data security through privacy-preserving computing technologies such as federated learning; promoting few-shot learning to address the challenge of scarce medical data; enhancing model interpretability to increase doctor trust; and accelerating the standardization of industry terminology and data formats to promote cross-institutional model migration and collaborative applications.
