According to our (Global Info Research) latest study, the global Hearing Screening Equipment market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A hearing screening is a quick test to see how well you hear different sounds. You either pass or fail the screening. If you pass and have no other hearing concerns, then you can continue with regularly scheduled hearing screenings. If you fail, or if you have other concerns about your hearing, then you may need more in-depth testing to see if you have a hearing loss and what treatment options may be right for you.

Today, most hospitals screen babies' hearing shortly after birth. Failing the hearing screening does not mean that your baby has a hearing loss. Not all babies pass the hearing screening the first time. Your baby can get a second screening to verify the results.

Hearing screenings for newborns and infants are simple and painless. Your baby rests or sleeps during the test. The two common screening methods for babies are otoacoustic emissions (OAEs) and auditory brainstem response (ABR).
