Abstracts

Cardiopulmonary bypass (CPB) is a form of extracorporeal circulation in which the patient's blood is diverted from the heart and lungs and rerouted outside of the body. The normal physiologic functions of the heart and lungs, including circulation of blood, oxygenation, and ventilation, are temporarily taken over by the CPB machine. In most cases, the heart is also separated from the circulation (eg, aortic cross-clamping) and cardioplegia solution is administered to allow the cardiac surgeon to operate on a nonbeating heart in a field largely devoid of blood, while other end organs remain adequately oxygenated and perfused.

According to our (Global Info Research) latest study, the global Heart Lung (Cardiopulmonary) Bypass Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
