According to our (Global Info Research) latest study, the global Heart Valves market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Heart valve disease occurs when heart valves do not work properly the way they should. The heart has four valves (the tricuspid, pulmonary, mitral, and aortic valves); these valves have tissue flaps that open and close at each heartbeat. The heart valve flaps make sure blood flows in the right direction through your heart's and to the rest of your body. Birth defects, age-related changes, infections, or other medical conditions can cause one or more of your heart valves to not open fully or to let blood leak back into the heart chambers. These conditions make your heart work harder and affect its ability to pump blood.

The normal invasive and MI procedures used by physicians often lead to complications like pleural effusion, arrhythmia, pleuritis, pericardial effusion, pericarditis, and infections in the lungs. This has led to physicians opting for minimally invasive catheter-based heart valve replacement surgery to reduce complications. Proven to be safe and efficient, these minimally invasive procedures reduce the need for blood transfusions, the risk of infections, hospital stays, and lead to rapid healing and recovery and better clinical outcome. As a result of their benefits, many cardiologists are opting these methods over invasive, and open heart surgeries and vendors have started manufacturing products for use during minimally invasive procedures. This increase in implementation of minimally invasive procedures is considered to be one of the primary drivers that will fuel the growth of this market in the coming years.
