Abstracts

The global Heat-Curing Adhesives market size is expected to reach \$ 1834.1 million by 2029, rising at a market growth of 6.3% CAGR during the forecast period (2023-2029).

Growing demand for curable adhesives in the automotive and construction sectors is expected to be a significant factor driving market growth. The ability of curing agents to bond a variety of substances including glass, fibers, wood and metals used in automotive parts, furniture and textile applications will likely guide future product demand. Thermoset adhesives will witness the highest growth compared to other product categories due to high utilization of medical devices. Additionally, its widespread applications in metal fabrication and metal bonding in electronics and automotive industries are expected to drive market growth over the forecast period.

Heat-curing adhesives use thermosetting resins containing reactive groups as adhesives. When the curing agent is added or heated, the molecules of the liquid adhesive can be further polymerized and cross-linked to form a network structure, forming an insoluble and infusible solid adhesive layer to achieve the purpose of bonding. The thermal curing adhesive has high bonding strength. At the same time, it has excellent heat resistance, aging resistance and chemical resistance. It can be cured at room temperature or cured by heating. The former is called room temperature curing adhesive, and the latter is called heating curing adhesive.
