A heat deflection temperature Vicat softening point tester is a device used to measure the temperature at which a plastic material begins to soften under a certain load. It typically consists of a heating device, a penetration needle, and a temperature sensor. By heating the plastic sample and applying a load, and then measuring the displacement of the penetration needle and the temperature, the heat deflection temperature and Vicat softening point of the plastic can be determined. This instrument is widely used in industries such as plastics, rubber, and composites for material performance testing and quality control.
