Heated non combustible tobacco bombs are a new type of tobacco product, also known as heated tobacco products, heated non combustible tobacco products, or heated non combustible tobacco products. Unlike traditional cigarettes, heated non burning bombs do not produce smoke by burning, but rather release nicotine and other chemicals by heating the tobacco. The heating non combustible smoke bomb usually consists of two parts: an electronic heating device and a smoke bomb. The electronic heating device is similar to the design of Electronic cigarette, which can heat the tobacco in the cigarette bomb without burning it. Cigarette bombs contain tobacco blocks or other forms of tobacco, usually specially treated to adapt to heating rather than burning. When using a heated non combustible smoke bomb, the user inserts the bomb into the electronic heating device and heats the bomb by activating the device. During the heating process, nicotine and other chemicals in tobacco are released, forming a smoke like gas for users to inhale. Due to the lack of non combustion process, compared to traditional cigarettes, the quality of chemicals released by heating non combustion bombs may be lower. Heated non combustible smoke bombs are considered a potential alternative to traditional cigarettes as they can provide a smoking like experience while reducing the generation of harmful substances produced by burning tobacco. However, although heated non combustible smoke bombs may have lower risks compared to traditional cigarettes, there are still potential health hazards, and their specific health effects require more scientific research and evaluation.
