Heat-reflective coated glass, also known as sunlight control coated glass, is a functional glass that is coated with multiple layers of metal (such as gold, silver, copper) or its compound thin films on the surface of high-quality float glass through vacuum magnetron sputtering, chemical vapor deposition and other processes. Its main function is to adjust the visible light transmittance by selectively reflecting and absorbing different bands of sunlight (such as reflecting infrared rays and absorbing ultraviolet rays), thereby achieving effective control of solar radiation while also having a decorative effect. Heat-reflective coated glass is widely used in the fields of construction and transportation due to its dual functions of energy saving and decoration. In the future, driven by green buildings and intelligent manufacturing, the market size is expected to grow further.
