Abstracts

Heat-reflective coated glass is coated with metal, non-metal and its oxide film on the glass surface to make it have a certain reflection effect, which can reflect solar energy back into the atmosphere and achieve the purpose of blocking solar energy from entering the room and preventing solar energy from being converted into heat energy indoors. The main characteristics are: good transparency in the visible light range of $\lambda=0.4\mu\text{m}\sim 0.7\mu\text{m}$, and high reflectivity for the ultraviolet band below $0.4\mu\text{m}$ and the infrared band with a wavelength of $0.7\mu\text{m}\sim 2.5\mu\text{m}$, which can save energy. Up to 30% or more.
