Abstracts

The global Heavy Barium Carbonate market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

In the context of MLCC (Multilayer Ceramic Capacitor) manufacturing, heavy barium carbonate is commonly used as a key component in the production of the ceramic dielectric layers. The dielectric layers in MLCCs are made of a mixture of ceramic powder and binders. Heavy barium carbonate is added to this mixture to adjust the properties of the ceramic material.

The use of heavy barium carbonate in MLCCs offers several advantages. Firstly, its higher density contributes to a higher mass per unit volume of the ceramic dielectric layers, which can enhance the capacitance value of the MLCC. This is particularly important for applications where higher capacitance values are required.

Secondly, heavy barium carbonate helps to improve the densification and sintering characteristics of the ceramic layers during MLCC manufacturing. This can lead to better control of the shrinkage and porosity, resulting in improved electrical performance and reliability of the MLCCs.

It's important to note that the specific formulation and application of heavy barium carbonate in MLCCs can vary between manufacturers and products. The concentration and processing conditions may be adjusted to meet the desired performance and characteristics required for specific MLCC applications.

Heavy barium carbonate, also known as precipitated barium carbonate, is a chemical compound with the formula BaCO_3 . It is the regular form of barium carbonate,

characterized by its higher density compared to light barium carbonate.

This report studies the global Heavy Barium Carbonate production, demand, key manufacturers, and key regions.
