According to our (Global Info Research) latest study, the global Heavy Duty Robot Platform market size was valued at USD 270.2 million in 2023 and is forecast to a readjusted size of USD 385.2 million by 2030 with a CAGR of 5.2% during review period.

Heavy duty robot platforms are mobile platforms that make use of sensors, visual systems, and steering and positioning systems to support mobile navigation. These robots possess a communication network that links them to the operator for controlling movement. These mobile platforms have a payload capacity of greater than 35 lbs and are deployed in rugged terrain only. Heavy duty robot platforms are equipped with advanced electronic and mechanical components, quantitatively segmented by application, solution, and geography.

Owing to the high requirement of power by the robots used in the rough terrains to cross obstacles, the need for the power backup and batteries used in these heavy-duty robots is higher. This increases the need for heavy duty robot platforms to have a substitute power supply and self-charging ability that enables them to work without any interruption. The automation of industrial operations with less manpower involvement can result in production lag, especially in cases where the platform drains its power. Owing to this, heavy duty robot platforms are equipped with solar-powered energy and swapping battery facility, enabling exchange of their discharged battery with a fully charged batteries from the charging station. This will lead to the growth of the heavy duty robot platform market during the forecast period.
