## Abstracts

The global Heavy Metal Remover market size is expected to reach \$ 472 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032). Heavy metal removers refer to a class of chemical substances that can effectively remove heavy metal ions (such as lead, cadmium, mercury, etc.) in the environment. They react with heavy metal ions through different physical or chemical mechanisms (such as precipitation, adsorption, complexation, etc.), thereby reducing their concentration or toxicity to achieve the purpose of purifying environmental media. These removers have important application value in the fields of environmental governance and wastewater treatment.

The heavy metal remover market is essentially a high-demand niche within industrial and municipal wastewater treatment chemicals. This demand stems directly from the high toxicity, non-degradability, and bioaccumulation risks of heavy metals: numerous reviews indicate that metals such as lead, cadmium, mercury, and chromium are widely present in water bodies and sediments at levels exceeding safety standards, making them one of the most challenging pollutants in the current aquatic environment and posing a long-term threat to ecosystems and human health. In China and the broader Asian region, rapid industrialization and urban expansion have significantly increased the discharge of heavy metal-containing wastewater and solid waste from industries such as metallurgy, mining, electroplating, and chemicals. Multiple studies confirm that heavy metals have become one of the main pollutants in coastal and inland water bodies and soils, creating a sustained demand for heavy metal removal agents. In terms of treatment technology, traditional chemical precipitation (hydroxides, sulfides), flocculation, and ion exchange remain the main methods for achieving compliance with heavy metal discharge standards in industrial wastewater. However, academia and engineering fields have significantly increased research and application of high-efficiency technologies such as adsorption, functional materials, and

chelation/complexation in recent years, leading to a market shift from 'low-cost bulk precipitants' to highly selective, renewable adsorbents and bio-based or biodegradable chelating agents. Simultaneously, WHO drinking water guidelines and national emission standards set extremely low permissible concentrations for arsenic, lead, and chromium (generally in the range of 0.01-0.07 mg/L), requiring many traditional processes to incorporate more sophisticated heavy metal removal units. This further increases the unit value and penetration rate of high-performance removal agents. Overall, the global heavy metal removal agent market exhibits characteristics of 'rigid demand, regulation-driven growth, and technological upgrading': Asia, particularly China and South Asia, is the core region for demand growth, with upstream products evolving from simple precipitants to complex formulations, functional adsorption materials, and environmentally friendly chelating agents. The industry competitive landscape is composed of multinational water treatment chemical and material companies and regional specialized manufacturers.
