A heavy work class ROV (Remotely Operated Vehicle) is a type of remotely controlled submersible vehicle primarily comprising a communication system, control system, and propulsion system. During operation, a heavy-duty work-class ROV receives electrical power and control signals from a surface support vessel through an umbilical cable. Operators on the support vessel issue commands from the control console, and these signals are transmitted to the control unit of the ROV main body via the umbilical cable. The control unit then activates the propulsion system, causing the propellers to rotate and enabling the ROV to move underwater. Simultaneously, sensors collect information and transmit it back to assist in operations. The equipment can be equipped with a mechanical arm to conduct observations, research, maintenance, salvage operations, and other tasks as required, operating in water depths of several thousand meters.
