Abstracts

According to our (Global Info Research) latest study, the global HEK293 Cell Line market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Increasing demand for HEK293 cell lines, development of biomedical research technologies, clinical applications of cell therapy and gene therapy, and continuous regulation across the biopharmaceutical industry are the key factors driving the growth of the HEK293 cell line market revenue.

The HEK293 cell line is a permanent line established from primary embryonic human kidney, which was transformed with sheared human adenovirus type 5 DNA. The adenoviral genes expressed in this cell line allow the cells to produce very high levels of recombinant proteins.

Due to the multiple copies of adenovirus E1A and E1B genes, HEK293 cells have a high transfection efficiency. This makes them useful in biotechnology, especially protein expression, gene therapy and vaccine production.

The pharmaceutical industry uses HEK293 cells for high-throughput screening assays because they can be transfected with plasmids encoding drug targets and grown in large numbers.

In industrial biotechnology, HEK293 cells are used to produce recombinant proteins and enzymes and to develop biosensors. Toxicology researchers, on the other hand, use

HEK293 cells to study the effects of chemicals and environmental toxins on cellular processes and gene expression.

HEK293 cells are also used to produce recombinant viruses, such as adenoviruses and lentiviruses, for gene therapy, viral replication, and host-virus interactions.

Overall, the HEK293 cell line is versatile and can be used in biomedical research with applications in biotechnology, pharmaceuticals, and toxicology.
