Abstracts

Helicobacter pylori is a type of bacteria that is known to be a major cause of peptic ulcers, which are sores on the lining of the esophagus, stomach or small intestine. H. pylori testing detects an infection of the digestive tract caused by the bacteria to help diagnose the cause of symptoms and/or ulcers.

H. pylori infections of the digestive tract are very common, with as many as half of the world's population infected. However, most people with H. pylori never have any symptoms. Still, H. pylori infection increases the risk of developing ulcers (peptic ulcer disease), persistent stomach inflammation (gastritis), and gastric (stomach) cancer. The bacteria decrease the stomach's ability to produce mucus, making the stomach prone to damage from digestive acid and peptic ulcers.
