Abstracts

The word avionics is a combination of aviation and electronics. Both the fixed-wing aircraft and rotorcraft highly depend on avionic systems, which consists of electromechanical elements and electronic devices for their operations. For instance, the fly-by-wire control system depends on digital computers for its performance. The avionic systems include equipment for communication, cockpit display, control and monitoring, and navigation and other electromechanical systems. The growing number of innovations in technology have also raised the demand for modern avionics as they offer improved reliability and enhanced functioning. Avionic systems provide pilots with critical data such as aircraft altitude, airstream incidence, and air speed with the help of air data sensors, accelerometers, pilots control stick sensor assembly, rate gyros, and other systems.

Scope of the Report:

This report focuses on the Helicopter Avionics in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Avionics systems play a major role in the efficient movement of helicopters and require frequent updates at regular intervals to ensure the safety of the passengers and crew. These systems offer pilots with critical data such as aircraft altitude, airstream incidence, and air speed through the assistance of accelerometers, air data sensors, pilots control stick sensor assembly, rate gyros, and other systems. Additionally, some helicopters are also employing synthetic vision systems (SVS), which allows the pilot to have a clear view even under low-visibility conditions. Similar technological

developments like ERAM, H-TWAS, auto ground collision avoidance system (Auto-GCAS) expand aircraft operational capability and enable cost savings. Such advances in technology in the field of avionics are a major driving force for several helicopter modernization initiatives. For instance, Boeing, NASA, and Rockwell Collins have collaborated to introduce cockpit avionics systems like autopilots, cockpit displays, and FCS.

Radio-frequency identification (RFID) tags are extensively used to track the helicopters electronically. They are widely used across military, aerospace, and retail markets. The manufacturing efficiency can be enhanced using RFID tags as they enable manufacturers to manage their spare parts inventory. These tags allow manufacturers to authenticate their parts during procurement or use. Several maintenance companies can use this technology to recognize defective parts quickly, ensuring proper error identification of the parts. The high-memory tags ensure value proposition of the flyable parts and can be used for guaranteed access to a network and sharing of information.

The worldwide market for Helicopter Avionics is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
