According to our (Global Info Research) latest study, the global Helium-free Magnetocardiograph market size was valued at US\$ 18.63 million in 2025 and is forecast to a readjusted size of US\$ 29.58 million by 2032 with a CAGR of 7.6% during review period.

Liquid helium free magnetocardiography (non superconducting magnetocardiography) is a high-end diagnostic device based on room temperature magnetic sensing technology for non-invasive detection of weak magnetic fields in the heart. It usually uses an optical pump magnetometer or other high-sensitivity room temperature magnetic sensing solutions. Compared with superconducting systems, it does not require low-temperature cooling and complex shielding, and has more friendly installation and operation conditions, making it more suitable for clinical promotion and application. Based on existing data, the global sales volume is estimated to be around 23 units in 2025, with an average unit price of approximately \$787000. Due to the complexity of system integration and the supply of core sensors, the overall industry capacity utilization rate is approximately 68%. Upstream enterprises are mainly distributed in the fields of high-sensitivity room temperature magnetic sensors, precision optical devices, low-noise electronic and signal processing chips, magnetic shielding materials, etc., while downstream enterprises are concentrated in the fields of medical equipment manufacturing, clinical system integration, and hospital delivery services, with an overall gross profit margin of about 35% to 48%. In the product cost structure, core magnetic sensors and optical systems account for about 40% of the total cost, electronic and algorithm hardware account for about 20%, system integration and assembly account for about 20%, research and development testing accounts for about 10%, and sales and after-sales service account for about 10%. According to parameters

and configurations, non superconducting magnetocardiography can be classified into fixed and semi mobile systems, as well as different configuration versions for scientific research and clinical screening. In terms of demand, the downstream demand list includes early screening for arrhythmia and cardiomyopathy in large hospitals, monitoring of cardiac function in newborns and children, evaluation of cardiac inflammation and drug cardiac safety, construction of regional cardiovascular diagnosis and treatment centers, and research on biomagnetism in universities and research institutions; The downstream customer list mainly includes cardiology departments of tertiary hospitals, specialized cardiac hospitals, medical research institutes, and high-end physical examination and functional medicine centers. In terms of business opportunities, policy drivers are reflected in the continuous strengthening of early diagnosis and screening of cardiovascular diseases and support for the localization of high-end medical equipment. Technological innovation drivers are focused on improving the sensitivity of room temperature magnetic sensing, the maturity of multi-channel array algorithms and artificial intelligence assisted interpretation, and changes in consumer demands are reflected in the significant increase in clinical attention to non-invasive testing, controllable operation and maintenance costs, and higher cost-effectiveness solutions. These factors together promote non superconducting magnetocardiography to become the most important incremental direction in the magnetocardiography market in the coming years.

The absence of liquid helium magnetocardiography represents an important direction for the evolution of the magnetocardiography industry towards scalable clinical applications. Its core value lies in completely eliminating the dependence on liquid helium, significantly reducing operational complexity and long-term usage costs, and enabling magnetocardiography to move from a few research centers to more clinical scenarios. The current market is still in the stage of introduction and verification, with installations mainly concentrated in technologically advanced cardiac specialty hospitals and research institutions. However, with the improvement of room temperature magnetic sensor sensitivity, mature low-noise algorithms, and advances in system level magnetic shielding and compensation technology, the liquid helium free solution is rapidly approaching traditional superconducting systems in terms of clinical availability and stability. From the demand side, hospitals place significantly higher emphasis on equipment reliability, continuous operation capability, and full lifecycle cost than on extreme sensitivity, making liquid helium free magnetocardiography more attractive in medical institutions with budget constraints but pursuing advanced diagnostic capabilities. In the medium to long term, the support of policies for the localization and green low-carbon operation of high-end medical equipment, the evolution of technological routes towards standardization and modularization, and the continuous

growth of patients' demand for non-invasive and precise cardiac testing will jointly promote the steady increase in the market share of liquid helium free magnetocardiography, becoming a key breakthrough for the magnetocardiography industry to move from a high barrier niche market to a sustainable and high-volume market.
