## Abstracts

Hematoxylin is a permanent stain extracted from hematoxylinum, which is oxidized to form hematoxylin, which can be used together with mordant (usually trivalent iron or aluminum salts) to stain cell nuclei.

According to our (Global Info Research) latest study, the global Hematoxylin Staining Solution market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Hematoxylin, commonly used in nuclear staining, is isolated and extracted from hematoxylin (Haematoxylin campechianum). In 1865, Bohmer stained biological samples with hematoxylin. In 1903, Mayer improved the formula, and many improved formulas followed. Of these, Harris, Gill, Mayer's and Weigert's are still in use today. Before hematoxylin staining, hematoxylin needs to be oxidized under the action of metal ions (mordant). Mordants are aluminum or iron salts.

Before hematoxylin can be used for nuclear staining, it must be oxidized to hematoxylin and combined with metal ions (mordants). The most successful mordants (metal ions) are aluminum or iron salts.

The hematoxylin staining solution used in routine histological and cytological staining is a regression staining method. Positively charged aluminum-hematoxylin oxide complexes bind to negatively charged phosphate groups of nuclear DNA. Hematoxylin staining produces a blue-violet color.

Harris hematoxylin stain is often used in combination with Pasteur stain for cytological staining
