According to our (Global Info Research) latest study, the global Hemodialysis Machine Disinfection Stick market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A hemodialysis machine disinfection stick is a device that is used to clean and disinfect the internal and external surfaces of a hemodialysis machine. Hemodialysis is a treatment that filters the blood of patients with kidney failure using a dialyzer, which is a filter that mimics the function of the kidney. Hemodialysis machines are devices that pump blood and dialysate (a fluid that helps remove waste and excess fluid from the blood) through the dialyzer. Hemodialysis machines need to be cleaned and disinfected regularly to prevent the growth of bacteria, fungi, and other microorganisms that can cause infections and complications for patients and staff. A hemodialysis machine disinfection stick is a device that contains a chemical agent, such as citric acid or sodium hypochlorite, that can be inserted into the machine and activated to perform a disinfection cycle. The disinfection stick can also remove calcium and magnesium deposits that can build up inside the machine and affect its performance.
