## Abstracts

According to our (Global Info Research) latest study, the global Hemorrhoid Model market size was valued at US\$ 233 million in 2025 and is forecast to a readjusted size of US\$ 300 million by 2032 with a CAGR of 3.8% during review period.

In 2025, global Hemorrhoid Model production reached approximately 2.83 M Units. The average price is approximately \$80. A Hemorrhoid Model is a specialized medical anatomical teaching model or clinical simulation trainer designed to visually demonstrate, explain, or simulate hemorrhoidal disease (internal and external hemorrhoids) within the anorectal region.

### Gross Profit Margin Levels

The hemorrhoid/anorectal training model market exhibits a typical structure of 'low-end volume sales, mid-to-high-end profit margins': Educational rigid PVC/resin models are mostly mass-produced using standardized molds, with simple materials and processes, and significant channel markups, resulting in manufacturing gross margins typically in the medium range. In contrast, rectal examination trainers, ligation/anoscope trainers, and lower gastrointestinal endoscopy training platforms rely more heavily on medical-grade silicone soft tissue formulations, replaceable consumables, complex assembly, and (for some products) sensor/software content libraries. These products are more likely to generate premium pricing and repeat purchases, leading to higher gross margins. Overall, the industry's common gross profit margin range is roughly 45%–70%: low-end educational models are closer to the lower end of this range, while mid-to-high-fidelity soft tissue trainers and the 'equipment + consumables/content' model are closer to the upper end. Furthermore, an increase in the proportion of services

(courses/subscriptions/certifications) will further boost the overall gross profit margin.

## Industry Drivers

The core driving force behind the growth of these models is not merely the 'prevalence of hemorrhoids,' but rather the standardization, quantification, and replicability of medical training and outpatient communication. On one hand, digital rectal examination/anal examination has fundamental value in assessing various anorectal problems (including the identification and differentiation of palpable or related lesions such as hemorrhoids), making 'repeatable and assessable' DRE/PR trainers a necessity for educational institutions and hospital skills centers. On the other hand, minimally invasive hemorrhoid treatment (such as banding) is common in outpatient settings and requires a high level of skill and instrument coordination, but in reality, 'available commercial training devices' are not always sufficient, prompting the continuous emergence of low-cost/reusable training models and standardized courses. Simultaneously, digestive endoscopy training increasingly emphasizes 'simulation first, then human intervention,' and extensive research and practice are also promoting the systematization of simulation training, driving the continuous expansion of lower gastrointestinal training products related to the rectal segment.
