## Abstracts

According to our (Global Info Research) latest study, the global Hemorrhoidal Circular Stapler market size was valued at US\$ 260 million in 2025 and is forecast to a readjusted size of US\$ 331 million by 2032 with a CAGR of 3.5% during review period.

A hemorrhoidal circular stapler is a single-use mechanical stapling device used in anorectal surgery for the treatment of internal hemorrhoids, prolapsed hemorrhoids, rectal mucosal prolapse and related anorectal mucosal disorders. It is mainly used in procedures such as Procedure for Prolapse and Hemorrhoids, Tissue Selecting Therapy and selected stapled transanal rectal resection or mucosal prolapse repair techniques. A typical device includes an anvil, stapling and cutting assembly, circular knife, titanium staples, movable handle, fixed handle, adjusting knob, safety lock, firing indicator, anal dilator, anoscope, suture threader and tissue traction accessories. During the procedure, the target mucosal or mucosal-muscular tissue is drawn into the stapler housing through purse-string suturing or selective traction. When the device is closed and fired, circular or selective rows of staples are formed while the circular knife resects excess tissue, thereby removing prolapsed mucosa, lifting the hemorrhoidal cushion, interrupting abnormal blood supply and restoring anorectal anatomy. Key performance indicators include cartridge volume, staple height, cutting diameter, compression uniformity, hemostatic performance, firing stability, tissue accommodation capacity, accessory completeness and intraoperative visualization.

In 2025, the global production volume of hemorrhoidal circular staplers is projected to reach 1.62 million units, with an average price of \$156 per unit and an average gross margin of 46.5%.

Based on our research, hemorrhoidal circular staplers should be treated as a dedicated anorectal surgical stapling segment built around PPH, TST and selected STARR-related procedures, rather than as a generic circular stapler category. Conventional circular staplers are mainly used for gastrointestinal anastomosis, while hemorrhoidal circular staplers are designed for the anatomy and workflow of the anal canal and lower rectum. Their value lies in a larger tissue housing, appropriate staple height, accessory sets such as anal dilators and anoscopes, and the ability to perform mucosal resection and stapling above the dentate line. Official product information from Ethicon and Medtronic positions these devices specifically for hemorrhoidal disease and rectal prolapse procedures, while Chinese manufacturers such as Dongxing, Kangdi, Blue Sail Surgical and Golden Stapler use PPH, TST, anorectal stapler or hemorrhoidal stapler terminology in their product materials. This supports a narrow product scope that excludes ordinary gastrointestinal circular staplers, rubber-band ligators, skin staplers and endoscopic linear cutting staplers.

From a supply perspective, the global market has moved from an early multinational-led structure toward a more diversified landscape that includes multinational brands, a large Chinese surgical stapler manufacturing cluster, Indian domestic suppliers and regional export-oriented manufacturers. Johnson & Johnson, Medtronic and B. Braun retain brand recognition and clinical familiarity in developed markets and premium hospitals. Meril represents an India-based manufacturer with a dedicated hemorrhoids stapler platform. Chinese suppliers such as Touchstone, Frankenman, Panther, Golden Stapler, Victor Medical, Waston, Kangdi, Dongxing, Blue Sail Surgical and Verykind form the most active manufacturing base for this category. Compared with powered endoscopic staplers, hemorrhoidal staplers have lower unit prices and a larger number of suppliers, but long-term hospital adoption still depends on consistent staple formation, hemostatic performance, accessory completeness, registration status, surgeon training and local procurement access.

Demand growth is driven by anorectal surgery volumes, procedure availability in emerging markets and continued use of PPH and TST techniques in selected hospitals, rather than by a broad technology-driven expansion. Hemorrhoidal disease is common, but most patients are managed conservatively or with office-based procedures, rubber-band ligation, conventional hemorrhoidectomy or energy-based treatments. Hemorrhoidal circular staplers are more relevant for internal hemorrhoids, circumferential prolapse, rectal mucosal prolapse and cases where mucosal lifting and stapled repair are clinically appropriate. Their advantages include a standardized procedural workflow, simultaneous resection and stapling, less postoperative pain compared with some conventional excisional techniques, and relatively fast recovery.

However, the category is constrained by strict patient selection, procedure preference differences across regions and concerns around bleeding, recurrence, stenosis, urgency or other postoperative symptoms in certain cases. Therefore, the market is expected to grow steadily but not rapidly.

From a technology perspective, the category is evolving from standard circular PPH devices toward TST staplers, three-row staple designs, larger tissue housings, rotatable bodies, powered firing, selective mucosal resection and accessory-based individualized procedures. B. Braun's TST33 highlights Tissue Selecting Therapy, Dongxing's anorectal stapler materials describe integrated TST functionality and rotatable structures, Shangji Medical has introduced a powered anorectal stapler platform, and Waston and Meril emphasize three-row staple designs for improved hemostatic performance. Future differentiation will focus less on basic stapling mechanics and more on tissue accommodation, compression uniformity, staple formation stability, bleeding control, ease of positioning and procedure-specific accessories. The premium segment may continue to evolve through powered firing and selective resection designs, while standard PPH products are likely to remain highly price-competitive.
