In 2025, the global production capacity of Hemostatic Gel Matrix was approximately 5 million units.

Hemostatic Gel Matrix is a medical biomaterial used to control bleeding during surgical procedures by forming a physical barrier and promoting local coagulation. The product is typically composed of biocompatible polymers, absorbable materials, or biological components that create a gel-like structure at the bleeding site, providing rapid hemostasis and tissue compatibility. It is mainly used in general surgery, cardiovascular surgery, neurosurgery, dental surgery, and minimally invasive procedures. The product boundary includes injectable and preformed hemostatic gel matrix products, excluding traditional gauze, liquid hemostatic agents, and mechanical hemostatic devices.

The hemostatic gel matrix industry chain includes upstream suppliers of medical polymers, biological materials, active components, additives, packaging materials, and sterilization resources; the midstream sector covers formulation development, material processing, filling, sterilization, quality control, and regulatory validation; the

downstream sector includes hospitals, surgical departments, medical distributors, and healthcare institutions. Market growth is driven by increasing surgical procedures, demand for advanced hemostatic technologies, and adoption of minimally invasive surgery.
