Abstracts

The global Hepatocyte Growth Factor market size is expected to reach \$ 533 million by 2032, rising at a market growth of 27.3% CAGR during the forecast period (2026-2032).

Hepatocyte growth factor (HGF) (or scatter factor (SF) is a paracrine cellular growth, motility and morphogenic factor. It is secreted by mesenchymal cells and targets and acts primarily upon epithelial cells and endothelial cells, but also acts on haemopoietic progenitor cells and T cells. It has been shown to have a major role in embryonic organ development, specifically in myogenesis, in adult organ regeneration, and in wound healing.

Current drug development targeting the HGF pathway is bifurcated into neuroregeneration and oncology tracks, with clinical pipelines focused on indications such as diabetic neuropathy, ALS, spinal cord injury, stroke, and various solid tumors including NSCLC and gastric cancer. Globally, companies like Helixmith, AnGes MG, and Kringle Pharma are advancing gene therapies and recombinant proteins for neurological indications. Athira Pharma and AVEO are developing small molecules and antibodies targeting the HGF/c-Met axis, while Exelixis and Molecular Partners pursue broader oncology strategies via multi-target approaches. Beijing Northland represents China's early-stage involvement in this area. The landscape is marked by diversified modalities and parallel development paths, with several assets reaching late-stage trials or conditional approvals, indicating strong commercialization potential in regenerative medicine and rare diseases.
