## Abstracts

Hereditary Transthyretin Amyloidosis (HATTR) is caused by the misfolding of protein monomers derived from the tetrameric protein transthyretin (TTR). Mutations in the gene for TTR frequently result in instability of TTR and subsequent fibril formation. HATTR can be sub-classified into familial amyloid polyneuropathy (FAP) and familial amyloid cardiomyopathy (FAC). The deposition of TTR amyloid fibrils in various tissues leads to ATTR, including Familial ATTR (hereditary ATTR) and non-hereditary ATTR types. Familial ATTR is a rare disorder with unequal distribution all around the world.

According to our (Global Info Research) latest study, the global Hereditary Transthyretin Amyloidosis (HATTR) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
