According to our (Global Info Research) latest study, the global Heterojunction (HJT) PECVD Machines market size was valued at USD 1093.8 million in 2022 and is forecast to a readjusted size of USD 1998.9 million by 2029 with a CAGR of 9.0% during review period.

Heterojunction (HJT) PECVD Machines are a type of equipment used to manufacture solar cells. PECVD stands for Plasma Enhanced Chemical Vapor Deposition (Plasma Enhanced Chemical Vapor Deposition), which is a commonly used thin film deposition technique for the production process of solar cells.

Heterojunction solar cells use a heterojunction of two or more different semiconductor materials to form an efficient photoelectric conversion structure. PECVD technology is used to deposit thin films in silicon-based solar cells to enhance the performance of the cells. Specifically, PECVD machines convert gas-phase chemical precursors into solid-state materials through plasma generated by ionized gases under vacuum conditions, and form various thin films on the surface of silicon-based solar cells, such as silicon nitride films (SiNx) and Zinc oxide film (ZnO), used to improve the light absorption, reflection and charge separation efficiency of the cell.

A PECVD machine usually consists of a vacuum chamber, a gas source system, a radio frequency power supply and a control system. During operation, the precursor gas is introduced into the vacuum chamber, and under the action of the ionized gas, a plasma reaction is generated, so that the precursor is deposited on the surface of the silicon-based solar cell to form a thin film.
