Abstracts

According to our (Global Info Research) latest study, the global Hexahydroxytriphenylene market size was valued at US$ 3.60 million in 2025 and is forecast to a readjusted size of US$ 10.31 million by 2032 with a CAGR of 15.8% during review period.

2,3,6,7,10,11-Hexahydroxytriphenylene, commonly abbreviated as HHTP, is a rigid, planar, C3-symmetric triphenylene-based organic building block bearing six phenolic hydroxyl groups. It is used as a multitopic ligand or monomer for conductive MOFs, COFs, hydrogen-bonded frameworks, liquid-crystal-related materials, ?-conjugated porous materials, electrochemical materials and chemiresistive sensing platforms. Cu3(HHTP)2 is a widely studied semiconductive framework, and literature describes HHTP-based conductive MOFs for chemiresistive sensors, batteries and related electronic materials.

2,3,6,7,10,11-Hexahydroxytriphenylene, commonly abbreviated as HHTP, is a high-value aromatic polyphenol ligand rather than a bulk chemical. It is mainly used as a functional organic building block for advanced materials, especially conductive metal?organic frameworks, covalent organic frameworks, and porous electronic materials. Commercial suppliers typically offer it as a high-purity specialty reagent, indicating that the current market is still dominated by research, pilot-scale, and small-volume high-value demand.

The key technical appeal of HHTP comes from its six catechol-type hydroxyl groups, which can coordinate with metal ions such as Cu, Ni, Co, and Mg to form two-dimensional conductive MOFs, including Cu?(HHTP)? and Ni?(HHTP)?. These

materials combine porosity, electrical conductivity, redox activity, and ordered layered structures, making them attractive for chemiresistive gas sensors, electrochemical energy storage, CO? capture, electrocatalysis-related studies, and advanced thin-film devices. Recent studies continue to treat HHTP-based conductive MOFs as model systems for understanding conductive porous frameworks and device-oriented materials.

From a market perspective, HHTP is still a niche specialty chemical with strong growth potential but limited near-term volume. Demand is mainly driven by R&D activities in conductive MOFs/COFs, porous carbon precursors, electrochemical materials, gas sensing platforms, and environmental adsorption technologies. Large-scale commercialization will depend on whether downstream HHTP-based frameworks can overcome challenges in scalable synthesis, film processing, conductivity retention, moisture stability, and device integration.

Overall, HHTP should be viewed as a strategic advanced-material ligand rather than a conventional chemical intermediate. Its long-term value lies in enabling next-generation conductive porous materials for sensors, energy storage, carbon capture, and functional electronic materials.
