## **Abstracts**

According to our (Global Info Research) latest study, the global HF Acid Globe Valves market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

The hydrofluoric acid globe valve is a valve commonly used in pipeline systems with strong corrosive media such as hydrofluoric acid to cut off or control the flow of the medium. Globe valves are also known as gate valves or knife gate valves. Compared with ordinary globe valves, hydrofluoric acid globe valves need special materials and sealing structures to ensure their corrosion resistance and sealing performance in strong acid medium environments. Under normal circumstances, the main components of the hydrofluoric acid globe valve, such as the valve body, valve cover, and valve stem, need to be made of special materials, such as fluoroplastics, fluororubber, and stainless steel. The structure and working principle of the hydrofluoric acid globe valve are similar to those of ordinary globe valves. The opening and closing of the valve is realized by rotating the valve stem, thereby controlling the flow of the medium. In the closed state, the sealing structure of the valve can effectively prevent the leakage of hydrofluoric acid medium and ensure the safe and stable operation of the pipeline system.
