Abstracts

The global Hi-Pro Soybean Meal market size is expected to reach \$ 13878 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

Hi-pro soybean meal is a plant-based protein source obtained by extracting oil from soybeans through a specific process, resulting in a significantly higher protein content than ordinary soybean meal. Its core function is to provide essential, efficient, and economical protein and amino acid sources for livestock, poultry, and aquatic feed. It resolves the contradiction between the huge demand for high-quality protein in animals' rapid growth and health maintenance and the amino acid imbalance and low digestibility of conventional plant-based protein sources, thereby reducing the livestock industry's dependence on expensive animal proteins such as fishmeal and ensuring feed efficiency and farming profitability. The upstream layer consists of raw material planting and processing, mainly including soybean growers, crushing enterprises, and protein refining plants, responsible for producing high-protein soybean meal. The downstream layer is the application and consumption layer, directly serving feed production enterprises, large-scale farms (livestock, poultry, and aquatic), and pet food manufacturers. As a core protein raw material, it is formulated into various feeds and ultimately converted into meat, eggs, milk, and other animal protein products by farmed animals, entering the consumer market. In 2025, the output of Hi-pro soybean meal is estimated at approximately 20 million tons, with an average price of approximately US\$500 per ton, a gross profit margin of approximately 30%, and a single-line capacity of 250,000 tons per year.
