## Abstracts

According to our (Global Info Research) latest study, the global HID Grow Light market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

While fluorescent lights were a common type of indoor grow light in the past, HID lights are now the most popular. High intensity discharge lamps have high lumen/watt efficiency. There are several different types of HID lamps, including mercury vapor, metal halide, high pressure sodium, and conversion bulbs. Metal halide and HPS lamps produce a color spectrum somewhat similar to the sun and can be used for growing plants. Mercury vapor lamps were the first HIDs and were widely used for street lighting, but when it came to indoor gardening, they produced a relatively poor spectrum for plant growth, so they were mostly replaced by other types of HID for growing plants.

All HID grow lights require ballasts to operate, each with a specific wattage. Popular HID wattages include 150W, 250W, 400W, 600W, and 1000W. Among all sizes, 600W HID lamp is the most efficient, followed by 1000W, 600W HPS has 7% more light than 1000W HPS.

While all HID lamps work on the same principle, different types of bulbs have different starting and voltage requirements, as well as different operating characteristics and physical shapes. Because such a bulb will not work properly unless a matching ballast is used, even if the bulb is installed. In addition to producing lower levels of light, mismatched bulbs and ballasts can stop working, or even burn out instantly.
