Abstracts

According to our (Global Info Research) latest study, the global HID Inductive Ballasts market size was valued at US\$ 573 million in 2024 and is forecast to a readjusted size of USD 772 million by 2031 with a CAGR of 4.4% during review period.

HID inductive ballasts are high-pressure gas discharge lamp inductive ballasts, such as mercury lamps, sodium lamps, metal halide lamps, and xenon lamps. The HID inductive ballast is an iron-core inductive coil. The nature of the inductance is that when the current in the coil changes, the magnetic flux will change in the coil, thereby generating an induced electromotive force whose direction is opposite to the direction of the current, so It hinders the current change, so as to limit and stabilize the current.

The Asia Pacific region dominates the global market and is expected to continue its dominance over the forecast period due to increasing demand from developing countries such as China and India. Furthermore, increasing adoption of LED lighting in commercial and industrial sectors is expected to drive regional growth over the forecast period. Europe accounted for a large share due to rising adoption in countries such as Germany, Italy, France, UK, and Russia. Countries with high population densities are more prone to power outages; therefore, these countries have adopted magnetic ballasts faster than other regions so far. Street lighting utilities have adopted magnetic ballasts because they consume very little energy compared to alternatives such as incandescent bulbs or compact fluorescent lamps, while providing maximum light output at the lowest cost (CFL).
