Abstracts

The global High Availability Cluster Software market size is expected to reach \$ 2819 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

A high availability cluster (also called an HA cluster or failover cluster) is a group of computers that support server applications and are designed to be used reliably with minimal downtime. They provide continuous service in the event of system component failures by using high availability software to take advantage of the redundant computers in the group or cluster.

From the product perspective, '99.99% automatic fault recovery' or 4N products currently occupy the main market share, accounting for 92% of the global market share. In China, this share is about 93%. This is because the major players in the global market, such as IBM and NEC, currently focus their products on the 4N field.

From the perspective of product market application, the market size of cluster software is larger, and cluster software accounts for about 70% of the global market share. In China, this proportion is about 64%, which means that dual-machine software in the Chinese market has a higher share. This is because there are many small enterprises in the Chinese market, and the business of these enterprises is mostly concentrated in the dual-machine field, which has pushed up the dual-machine share in the Chinese market.

Currently, major global companies include IBM, NEC, Stratus, HPE, Microsoft, Oracle, Neverfail, Shanghai Yingfang Software Co., Ltd., Donyang Tech Technology Co., Ltd. (Rose), MicroFocus (Novell), etc. The top 10 major companies account for more than

78%.
