Abstracts

The global High Concentration Desizing Enzyme market size is expected to reach $ 160 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

High Concentration Desizing Enzymes are highly concentrated enzyme preparations used in the desizing stage of textile pretreatment (dyeing and finishing). Their primary active ingredient is ?-amylase, which targets starch, modified starch, and starch-based blends used for sizing the warp yarns of cotton, polyester-cotton, viscose, and blended fabrics.

Upstream inputs primarily include enzyme-producing microbial strains, fermentation carbon and nitrogen sources, inorganic salts, inducing substrates, stabilizers, preservatives, liquid carriers, and compounding auxiliaries. Production typically involves using bacterial or fungal strains for submerged liquid fermentation to generate ?-amylase, followed by separation, concentration, standardization, and formulation stabilization to create high-concentration liquid or powder products. Carbon sources may include starch hydrolysates, glucose, or maltodextrin, while nitrogen sources may include corn steep liquor, yeast powder, or peptone; stabilizers are employed to enhance storage stability as well as resistance to temperature and pH fluctuations.

In 2025, global sales volume is estimated at approximately 26,000 metric tons, with a global average price of around US$4,500 per ton. Major manufacturers in the industry typically achieve gross profit margins ranging from 25% to 38%.

This report studies the global High Concentration Desizing Enzyme production, demand, key manufacturers, and key regions.
