## Abstracts

High Content Imaging (HCI) systems are advanced imaging platforms that allow for the automated analysis of large numbers of cells or samples in a high-throughput manner. These systems typically combine high-resolution imaging capabilities with sophisticated image analysis software to extract detailed information about cellular morphology, function, and behavior. HCI systems are commonly used in drug discovery, toxicology studies, and basic research to screen for potential drug candidates, study cellular pathways, and investigate disease mechanisms. By capturing and analyzing images of cells or tissues, researchers can gain valuable insights into cellular processes and identify potential targets for therapeutic intervention. Overall, HCI systems are powerful tools for studying cellular processes and identifying potential drug targets, making them valuable assets in both academic research and drug discovery efforts.
