Abstracts

High-content screening (HCS) or high-content analysis (HCA) (also known as cellomics), is a set of analytical techniques that is applied in genetic research and drug discovery processes in order to recognize elements such as peptides, small molecules, or genetic materials (such as RNAi) that have the potential to modify the phenotype of a cell in a certain manner. High-content screening employs a set of analytical procedures such as multi-parameter image processing, automated microscopy, fluorescence imaging, and other visualization processes to get quantitative data from cell populations.

According to our (Global Info Research) latest study, the global High Content Screening market size was valued at USD 579.9 million in 2022 and is forecast to a readjusted size of USD 992.9 million by 2029 with a CAGR of 8.0% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The high-content screening market is anticipated to witness significant growth during the forecast period, owing to the ability of HCS to study several parameters in a complex biological system simultaneously.
