Abstracts

For high-density tungsten alloys, the tungsten content is usually above 90% (mass fraction), and its density is usually above 17. Due to the poor sintering performance of pure tungsten powder, it is difficult to reach the theoretical density even if it is sintered at a temperature close to its melting point. In addition, due to the brittle nature of tungsten, it is necessary to add a small amount of other metals to tungsten. Because high-density tungsten alloy has a series of excellent physical and mechanical properties and performance such as high density, high strength and hardness, good electrical and thermal conductivity, small thermal expansion coefficient, good corrosion resistance and oxidation resistance, good machinability and weldability, etc. , so it has been widely used in the field of modern science, defense industry and civilian industry.

According to our (Global Info Research) latest study, the global High Density Tungsten Alloy market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
